

Finance Performance Dashboard

Professional Project Case Study

Executive Summary

This project demonstrates how Microsoft Excel can be used as a Business Intelligence platform to convert a large banking dataset into an interactive executive dashboard. The solution focuses on clarity, usability and decision support.

Business Problem

Decision-makers often receive raw spreadsheets containing thousands of records. This makes it difficult to identify trends, monitor loan performance and evaluate financial risk efficiently.

Objectives

- Build an executive dashboard.
- Create meaningful KPIs.
- Enable interactive filtering.
- Support faster business decisions.
- Showcase practical Excel BI skills.

Methodology

1. Data Collection
2. Data Cleaning
3. Data Validation
4. Pivot Tables
5. Pivot Charts

- 6. KPI Cards
- 7. Interactive Slicers
- 8. Dashboard Design
- 9. Business Insight Generation

Key Performance Indicators

KPI	Purpose
Total Transaction Amount	Overall financial volume
Total Clients	Customer base
Approval Rate	Loan approval performance
Average Interest Rate	Pricing metric
High Risk Amount	Risk exposure
Largest Bank	Top contributor

Business Insights

The dashboard highlights bank-wise transaction volume, loan status, customer distribution, maturity status and risk exposure. Interactive slicers allow users to explore different business scenarios instantly.

Skills Demonstrated

Microsoft Excel, Data Cleaning, Data Analysis, Pivot Tables, Pivot Charts, KPI Reporting, Dashboard Design, Business Intelligence, Financial Analytics.

Future Roadmap

Next iterations will migrate this solution to SQL, PostgreSQL, Power BI and Python ETL pipelines, demonstrating an end-to-end analytics workflow.
